

FUNCTIONAL REQUIREMENT DOCUMENT(FRD)

Change Management Software Module for Pharmaceutical Industry

MAY 19, 2026
SMART FOOD SAFE COMPANY
Bangalore

1. Introduction

1.1 Purpose

This document is created to explain the Functional Requirement Document (FRD) for the Change Management Software used in the pharmaceutical industry. The purpose of this software is to help the company manage change requests in a proper and organized way.

This software helps employees and management teams to track changes, approvals, records, and workflow activities inside the organization. It also helps in reducing manual work and maintaining important information safely.

This document explains the features and functions that should be included in the software before the development process starts. It gives a basic idea about how the software should work and what functionalities it should provide to the users.

1.2 Objective

The main objective of this software is:

- To manage change requests properly
- To track approvals and updates
- To maintain records safely
- To make the workflow easier for employees
- To reduce manual work
- To improve communication between teams
- To help the organization manage changes efficiently

This software is mainly developed to make the change management process simple, faster, and more organized for the pharmaceutical company.

1.3 Scope

This software module will include:

- User login system
- Dashboard access
- Change request form
- Approval process
- Notification system
- Reports and tracking system
- User role management
- Document upload and record maintenance

The software will be used by employees, managers, and QA teams to manage and monitor change requests within the organization. Different users will have different access based on their roles and responsibilities.

This system will help the company improve tracking, approval handling, and record management in an efficient way.

2. User Roles

The Change Management Software will be used by different users inside the pharmaceutical organization. Every user will have a separate role and responsibility in the system. Different users will also have different access permissions based on their work and position in the company.

The main purpose of user roles is to maintain security, proper workflow, and smooth management of change requests inside the organization. This helps avoid unauthorized access and keeps important company records safe.

The software will allow users to log in using their username and password. After logging in, users can access features based on their assigned roles. Some users can create requests, while others can review, approve, or manage records.

User Role	Responsibility
Admin	The admin manages users, system settings, and software access. Admin can add or remove users and monitor overall activities in the system.
Employee	Employees can create and submit change requests related to products, processes, or documents inside the organization.
Manager	Managers review submitted requests and approve or reject them based on company requirements and policies.
QA Team	QA team checks records, verifies compliance, and ensures that all changes follow quality standards and company guidelines.
Reviewer	Reviewers check request details, provide comments, and help in the approval process before final implementation.

Each role plays an important part in managing the change request process properly. This role-based access system helps improve workflow management, approval tracking, communication between teams, and record maintenance inside the pharmaceutical company.

This software will help the organization maintain better control over change requests and improve overall efficiency in handling approvals and records.

3. Functional Requirements

The Functional Requirements section explains the important features and functions that should be included in the Change Management Software. These requirements help developers understand how the software should work and what functions should be available for users inside the organization.

The software should help users manage change requests, approvals, records, notifications, and workflow activities in a proper and organized way.

3.1 Login Module

The software should allow users to log in using their username and password. Each user should have secure access based on their role and responsibility inside the organization.

The login module should also include:

- Forgot password option
- Secure authentication
- User access management

3.2 Dashboard Module

The dashboard should display important information related to the system. Users should be able to easily view pending requests, approved requests, notifications, and recent activities.

The dashboard should help users quickly access different modules and monitor request activities inside the organization.

Features included:

- Pending request status
- Notifications
- Recent activities
- Quick access buttons

3.3 Change Request Module

Employees should be able to create and submit new change requests related to products, documents, materials, or processes.

The software should allow users to:

- Enter request details
- Upload supporting documents
- Edit request information before submission
- Submit requests for approval

3.4 Approval Module

Managers and reviewers should be able to review submitted requests and approve or reject them based on company requirements and approval process.

Approvers should also be able to:

- Add comments
- Provide suggestions
- Review uploaded documents
- Track request status

3.5 Notification Module

The software should send notifications and updates to users regarding request status, approvals, rejections, and workflow changes.

Notifications help users stay updated about ongoing activities inside the system.

The notification module should include:

- Approval notifications
- Request update alerts
- Reminder notifications
- Status tracking messages

3.6 Reports and Tracking Module

Users should be able to generate reports and track request history inside the system.

The software should maintain complete activity records safely for future reference and auditing purposes.

- Features included:
- Request tracking
- Activity history
- Reports generation
- Record maintenance

3.7 User Management Module

The system should provide role-based access for different users inside the organization.

Different users should have different permissions based on their roles such as:

- Admin
- Employee
- Manager
- QA Team
- Reviewer

3.8 Security and Data Protection Module

The software should maintain secure access and protect important company records and information.

The system should:

- Store records safely
- Protect user information
- Prevent unauthorized access
- Maintain data confidentiality

4. Workflow Process

The workflow process explains how the change request moves from submission to final approval inside the organization. This process helps the company manage requests in a proper and organized way. It also helps maintain records, approvals, and tracking activities inside the system.

The workflow process is important because every request should go through proper review, verification, and approval before implementation. Different users inside the organization are involved in different stages of the workflow process based on their responsibilities and roles.

Step 1 — User Login

The user logs into the system using their username and password. After successful login, users can access different modules and features based on their assigned roles and permissions.

Only authorized users should be able to access the system securely.

Step 2 — Create Change Request

The employee creates a new change request inside the system. The request may be related to products, raw materials, documents, workflow activities, or process changes inside the pharmaceutical organization.

Users should enter all required details properly before submitting the request.

Step 3 — Upload Supporting Documents

The employee uploads supporting documents and related files required for verification and approval process.

The uploaded documents may include:

- Reports
- Product details
- Process documents
- Supporting records

These documents help reviewers and managers understand the request clearly.

Step 4 — Submit Request

After entering all details and uploading documents, the employee submits the request into the system for review and approval.

Once submitted, the request moves to the next stage of the workflow process.

Step 5 — Review Process

Managers and reviewers check the submitted request carefully. They verify request details, uploaded documents, and related information before taking any decision.

Reviewers may also:

- Add comments
- Suggest modifications
- Request additional information

Step 6 — QA Verification

The QA team verifies whether the request follows company standards, quality guidelines, and compliance requirements.

This step is important in the pharmaceutical industry because all changes should follow proper quality and safety procedures.

Step 7 — Approval or Rejection

After review and verification process, the request is either approved or rejected.

If approved:

The request moves to implementation stage.

If rejected:

The user receives comments or reasons for rejection.

Step 8 — Notifications and Updates

The system sends notifications and updates to users regarding request status, approvals, rejections, and workflow changes.

Notifications help users stay updated about ongoing activities inside the system.

Step 9 — Record Maintenance

Final records, approval history, comments, and activity details are stored safely inside the system for future reference and auditing purposes.

The software should maintain complete records properly to support tracking and monitoring activities inside the organization.

5. Sprint-wise Breakdown

The development process of the Change Management Software is divided into different sprints. Each sprint focuses on specific modules and functionalities of the software. This helps the development team complete the project in an organized and systematic way.

Each sprint includes planning, development, testing, and review activities before moving to the next stage.

Sprint 1 — Login and Dashboard Module

Duration:

1 Week

Features Included:

- User login system
- Forgot password option
- Dashboard access
- Role-based user access

During this sprint, the development team will create the basic login system and dashboard interface for users. Users should be able to access the software securely using username and password.

The dashboard should display notifications, pending requests, and recent activities for users.

Sprint 2 — Change Request Module

Duration:

1 Week

Features Included:

- Create change request
- Edit request details
- Upload supporting documents
- Submit requests

This sprint focuses on the development of the change request process. Employees should be able to create and submit requests related to products, processes, materials, or documents.

The system should also allow document upload and request editing before submission.

Sprint 3 — Approval and Review Module

Duration:

1 Week

Features Included:

- Approval workflow
- Request review process
- Add comments
- Approve or reject requests

Managers and reviewers should be able to review submitted requests and verify uploaded information.

The system should support proper approval workflow and status tracking during this stage.

Sprint 4 — Notification and Reports Module**Duration:**

1 Week

Features Included:

- Notifications
- Status updates
- Reports generation
- Request tracking

This sprint focuses on sending notifications and generating reports inside the system.

Users should receive updates related to approvals, rejections, and request activities.

Sprint 5 — Testing and Bug Fixing**Duration:**

5 Days

Features Included:

- System testing
- Error checking
- Bug fixing
- Performance verification

The software should be tested properly to identify errors and system issues before final deployment.

Necessary corrections and improvements should be completed during this sprint.

Sprint 6 — Final Deployment and Go Live**Duration:**

3 Days

Features Included:

- Final system deployment
- User access verification
- Go live process
- Final review

The completed software will be deployed and made available for users inside the organization.

Final verification and system review should be completed before the software goes live.

6. Mock-up Screen(PPT/images)

Login Screen

Include:

- Company logo
- Username
- Password
- Forgot Password
- Login button
- Title idea:
- Pharma Change Management Portal

2. Dashboard Screen

Include cards like:

- Pending Requests
- Approved Requests
- Rejected Requests
- Notifications
- Recent Activities
- Sidebar menu:
- Dashboard
- Create Request
- Approvals
- Reports
- Users
- Logout
